Project Title

SmartLender: AI-Powered Loan Approval System

Problem Statement

The traditional loan approval process in financial institutions is heavily reliant on manual scrutiny. This method is not only time-consuming but also prone to human error and unconscious bias. Loan officers must manually verify applicant details against historical data, leading to delays in decision-making. Traditional rule-based software also fails to capture complex, non-linear relationships between an applicant's financial metrics and their likelihood of default.

Proposed Solution

SmartLender resolves these issues by leveraging Machine Learning. We developed a predictive model using the XGBoost algorithm, trained on historical loan data. The model automatically learns the intricate patterns that lead to loan approval or rejection. This model is deployed via a Flask web application, providing an instant, data-driven prediction along with a confidence score, thereby streamlining the banking workflow.

Target Audience

- **Primary:** Loan officers and bank employees who need quick, reliable decision support.

- **Secondary:** End-users/applicants who can use the system to check their loan eligibility before formally applying.

Technology Stack

- **Programming Language:** Python 3.12+
- **ML Libraries:** Scikit-Learn, XGBoost
- **Data Analysis:** Pandas, NumPy, Seaborn, Matplotlib
- **Web Framework:** Flask
- **Serialization:** Pickle
